Kensington IT Security & Laptop Theft Survey

Overview

Losing proprietary business data through the theft of laptops or other devices can be priceless, but when users are working in the office, IT may be lulled into a false sense of security that devices are safe on the premises. Research suggests that IT theft in the office is higher than what most would expect. While it might seem to be a reasonable assumption that employees could leave their laptops and other devices unsecured in their own workspaces worry-free, the evidence shows that IT theft in the office is nearly as high as theft in cars and other forms of transportation.

And laptops are just one type of equipment in the corporate arsenal that needs protection - monitors, external hard drives, printers, hubs, docking stations, and conference room phones are all vulnerable to theft and data loss, while users lose productivity.

Kensington, a worldwide leader of desktop productivity and mobility solutions for IT, business and home office professionals, conducted an IT Security & Laptop Theft Survey in July 2016, to shed light on how much IT professionals are concentrating on the physical device security of laptops and other office equipment.

Survey Results

The survey, which polled IT professionals across industries such as education, finance/banking, government, healthcare, manufacturing and professional services, revealed that:

- IT theft in the office ranks at 23%—almost as high as theft in cars and transportation (25%), and more than theft in airports and hotels (15 percent).
- More than a third (34%) of IT personnel do not have a physical security policy in place to protect their companies' laptops, mobile devices, and other electronic assets.
- More than half (54 percent) of survey participants do not currently utilize physical locks for IT equipment.
- 80% of survey respondents do not utilize locks to prevent theft of equipment such as projectors, hard drives, monitors or speaker phones.
- When deploying laptop locks, management of keys is an important consideration for nearly two-thirds (65 percent) of IT. Most IT directors would prefer to have a master key so that if an employee loses his/her key, the laptop can still be unlocked.

Summary

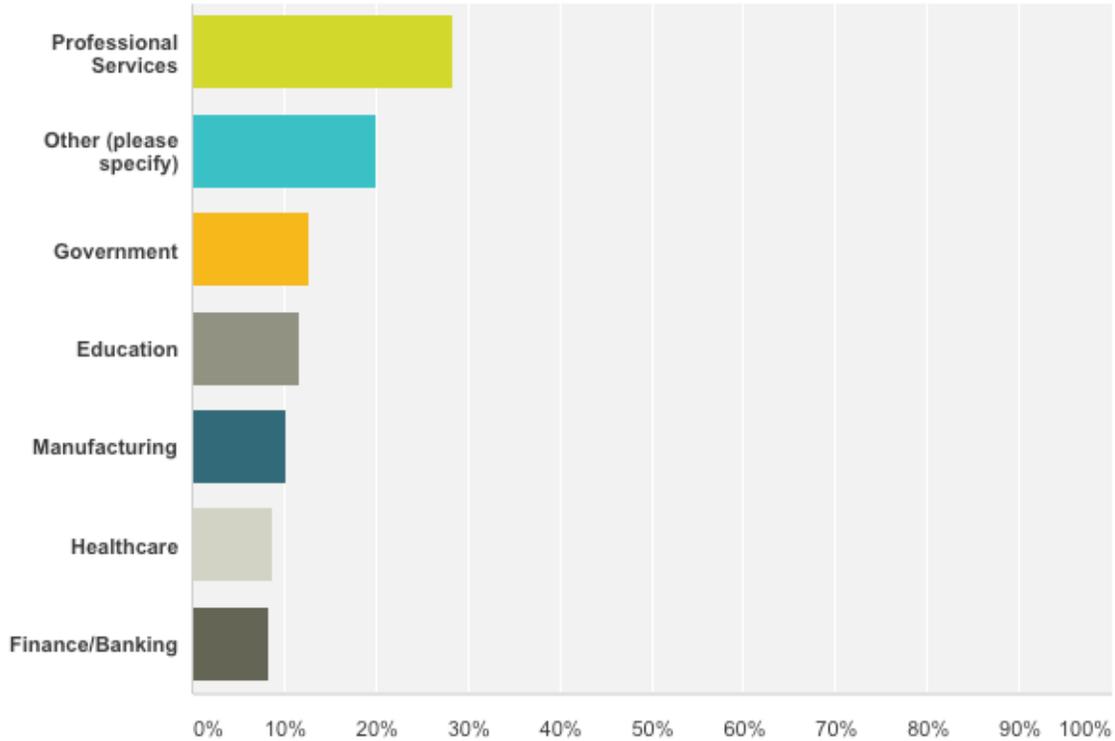

The survey findings show that a surprisingly high percentage of IT theft occurs in-house, and that IT directors and purchasers would benefit by implementing a formal physical security policy and taking steps to secure their devices and the sensitive data they contain. A well-implemented security strategy can significantly decrease laptop theft, and a consistent use of physical locks for computing and mobile equipment can provide resistance to tampering and theft.

The following content highlights survey questions and responses in detail.

Kensington IT Security & Laptop Theft Survey Results

Which industry do you work in?

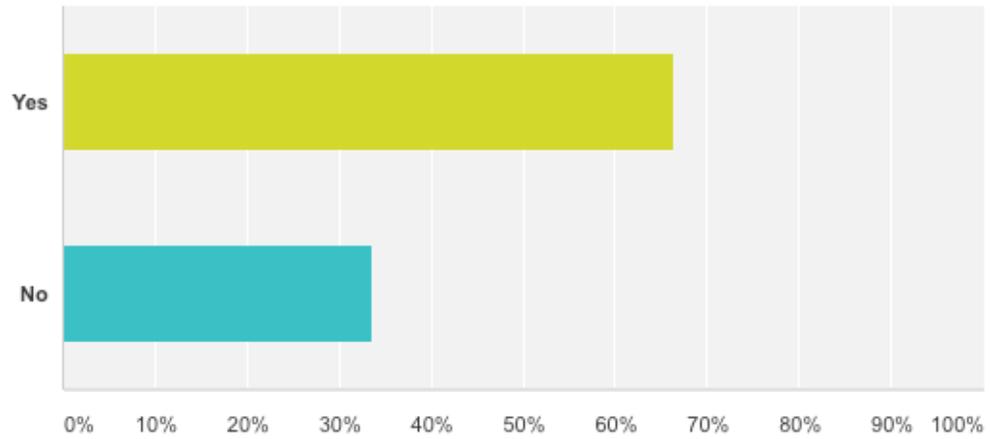

Answered: 300 Skipped: 0

Answer Choices	Responses
Professional Services	28.33% 85
